Research Interests

My research interests revolve around *game theory* and *statistical learning* and their interactions, in particular in the context of *security*, *privacy* and *ethics of online systems and algorithms*. I like to work on problems that have both fundamental theoretical aspects and important practical applications. My main current interests are in algorithmic fairness and transparency (in particular in online advertising); game theory for security and resource allocation (adversarial learning, Blotto games); learning and privacy; and interactions between game theory and learning (adversarial bandits, leaning in games, using the solution of games to analyze/design learning algorithms). I also worked on causal methods and applications to networking, cyberinsurance, scheduling and pricing in clouds and smart grids, large deviations and applications to networking and to medicine, long-range dependence and heavy-tails, and statistical estimation under sampling.
